

Can we continue to add workers to a farm and expect
the same increase in productivity and production?

No. At some point there will be “**too many**” workers, they will get on each other’s way and instead of improving productivity, additional workers will make everyone **less** productive

Additions to output with each worker hired will **slow down**
(get smaller not larger). Eventually, there will no longer be
any "addition" to Total Product and production **drops**.

Can we continue to add workers to a farm and expect the same increase in productivity and production?
