

What happens
when new money
comes in?

The Federal Reserve
Bank creates new money

\$

\$

\$

$$\Delta D = 3,000 \left(\frac{1}{1 - 0.9} \right)$$

Deposits increase by a
multiple $\left(\frac{1}{1 - 0.9} \right)$
of the new money injected

0.9 is the fraction of Deposits which banks are allowed to lend: 90%

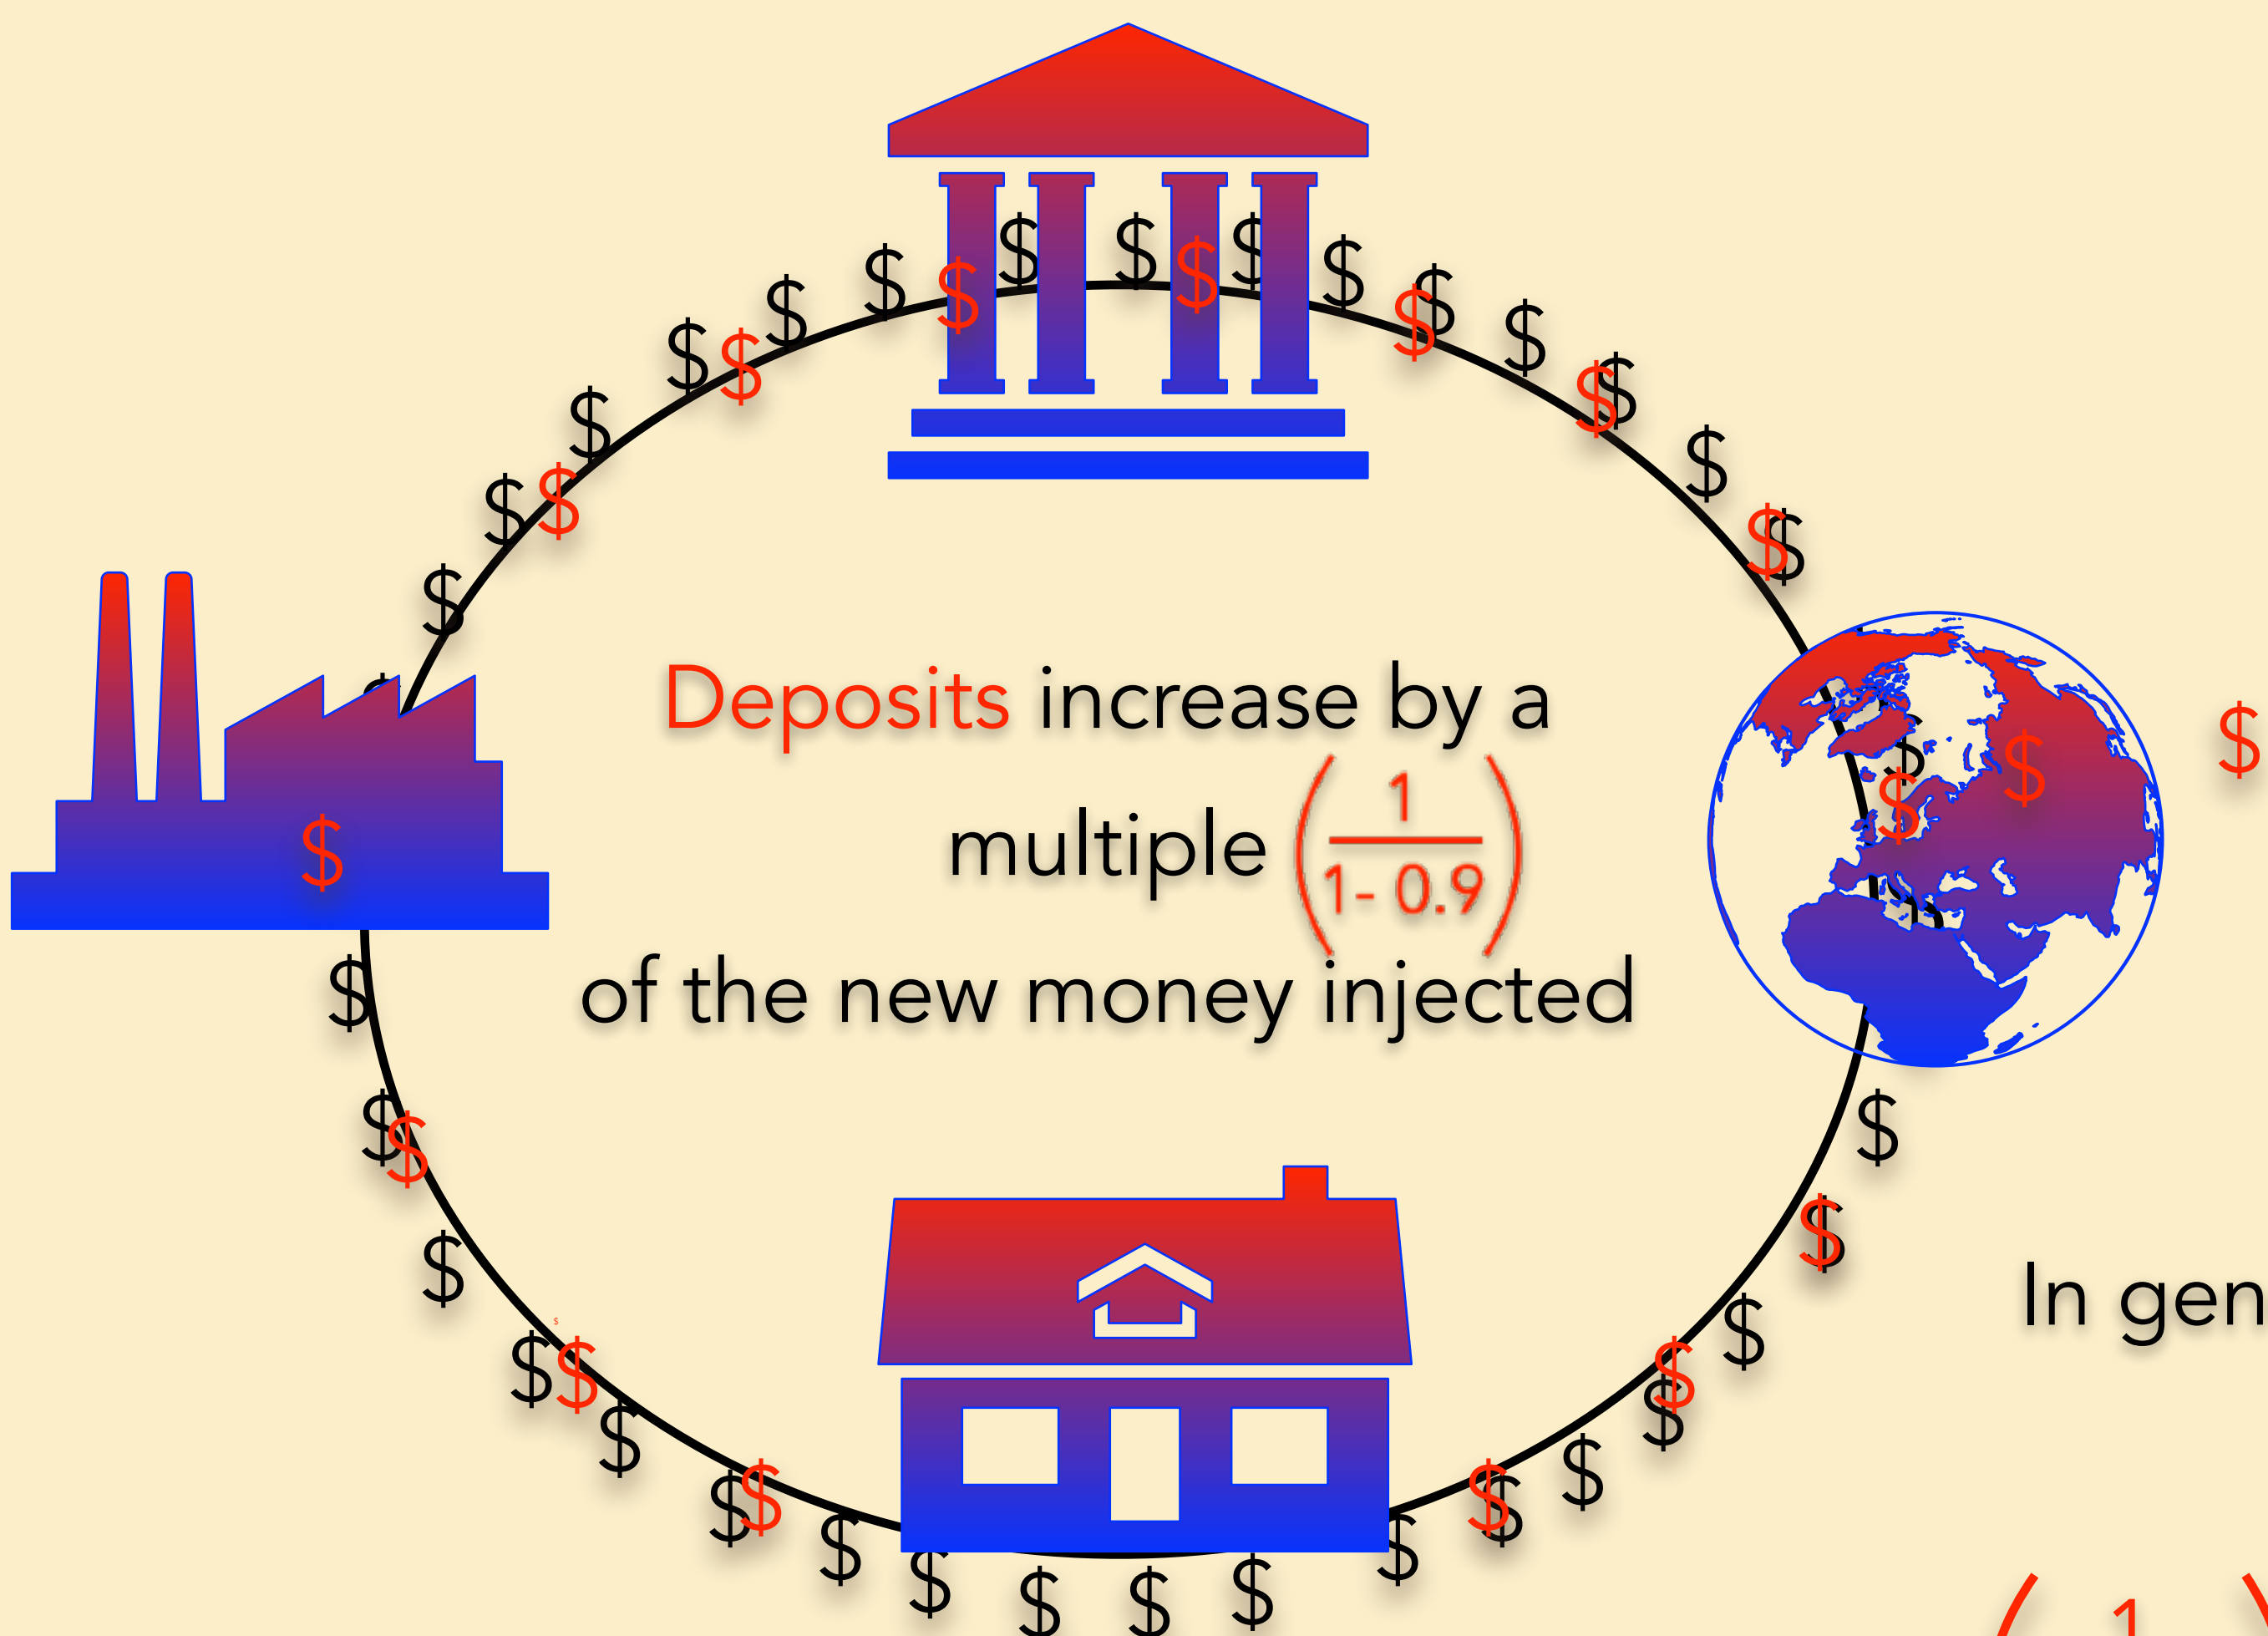

1-0.9 is the fraction (r) of Deposits which banks must keep in reserve: $r=10\%$

In general, we can write this "money multiplier" as

$$\left(\frac{1}{r} \right)$$

In general, we can write the increase in
Deposits as:

$$\Delta D = \text{New Money} \left(\frac{1}{r} \right)$$

The Federal Reserve Bank creates new money

In general, we can write the increase in Deposits as:

$$\Delta D = 3,000 \left(\frac{1}{1 - 0.9} \right) \qquad \Delta D = \text{New Money} \left(\frac{1}{r} \right)$$

0.9 is the fraction of Deposits which banks are allowed to lend: 90%

1 - 0.9 is the fraction (r) of Deposits which banks must keep in reserves: r = 10%

In general, we can write this "money multiplier" as $\left(\frac{1}{r} \right)$
