Total Production (Y^*)

AE

=

Y*

AE(above)

Y(Production)

AE(below)

Production Y (higher)

Where the two lines cross:

The distance to the 45°
line (production) is the
same as the distance to
the AE line (total sold):

No change in
inventories

$AE = Y^*$ We

sold exactly what we
produced

$AE > Y$ We

sold **more** than we
produced

We sold goods that
were in inventory:
inventories drop

$Y > AE$ We

sold **less** than we
produced

For any output level below Y^*

For any output level above Y^*

$Y - AE = \text{increase}$
in inventories

$$Y - AE = \text{drop}$$

in inventories

We could not sell all
we produced: Inventories
increase
