

Growth of labor productivity comes
from:

Increases in the stock of capital and

Improvements in technology

Growth of Potential GDP =

Potential GDP = Hours worked x Labor Productivity

x The Labor Force

Growth of labor productivity + Growth of labor force

Growth of Potential GDP =

Increases in the stock of capital + Improvements in
technology + Growth of labor force

doesn't change (8 hours/day)

$$\text{Potential GDP} = \text{Hours worked} \times \text{Labor Productivity} \\ \times \text{The Labor Force}$$

doesn't change (8 hours/day)

Growth of Potential GDP =

Growth of labor productivity + Growth of labor force

Growth of labor productivity comes from:

Increases in the stock of capital and
Improvements in technology

Growth of Potential GDP =

Increases in the stock of capital + Improvements in
technology + Growth of labor force

Costs of Unemployment
