

GDP

When we measure GDP, we want to know the **amount** of goods and services produced: **quantity** produced. But in measuring quantity we ran into two problems:

1. We **can not** add apples and oranges and web pages and computers and hair cuts: we **can not add quantities produced**

2. Goods have different intrinsic value: To build a computer, more **value is added** to the raw materials than the value added to produce a pencil: GDP must account for differences in value added.

GDP

When we measure GDP, we want to know the **amount** of goods and services produced: **quantity** produced. But in measuring quantity we ran into two problems:

1. We **can not** add apples and oranges and web pages and computers and hair cuts: we **can not add quantities produced**
2. Goods have different intrinsic value: To build a computer, more **value is added** to the raw materials than the value added to produce a pencil: GDP must account for differences in value added.

Prices solve both problems
