

When businesses report purchases made by Consumers, Firms, the Government and Other Countries, reported values include both **imported** and domestic goods. If we were to leave the formula to calculate GDP as:

$$\text{GDP} = \text{C} + \text{I} + \text{G} + \text{X}$$

Expenditures Approach

$$GDP = C + I + G + X - M$$

We would be including **foreign** production as U.S.

production. We must subtract foreign production:

Expenditures Approach

When businesses report purchases made by Consumers, Firms, the Government and Other Countries, reported values include both **imported** and domestic goods. If we were to leave the formula to calculate GDP as:

$$\text{GDP} = C + I + G + X$$

We would be including **foreign** production as U.S. production. We must subtract foreign production:

$$\text{GDP} = C + I + G + X - \text{M}$$

GDP = Production of new goods and services
