

Average quantity:

$$(30+18)/2 = 24$$

Average price

$$(7+5)/2 = 6$$

To calculate the % Change in Price we compare the difference in the prices:
 $7 - 5 = 2$ relative not to 7, not to 5 but to the number right in the middle between 5 and 7: The midpoint = 6

6

To calculate the % Change in Quantity we compare the difference in quantity: $30 - 18 = 12$ relative not to 30, not to 18 but to the number in the middle of 12 and 30: The midpoint = 24

24

We use the Midpoint Formula

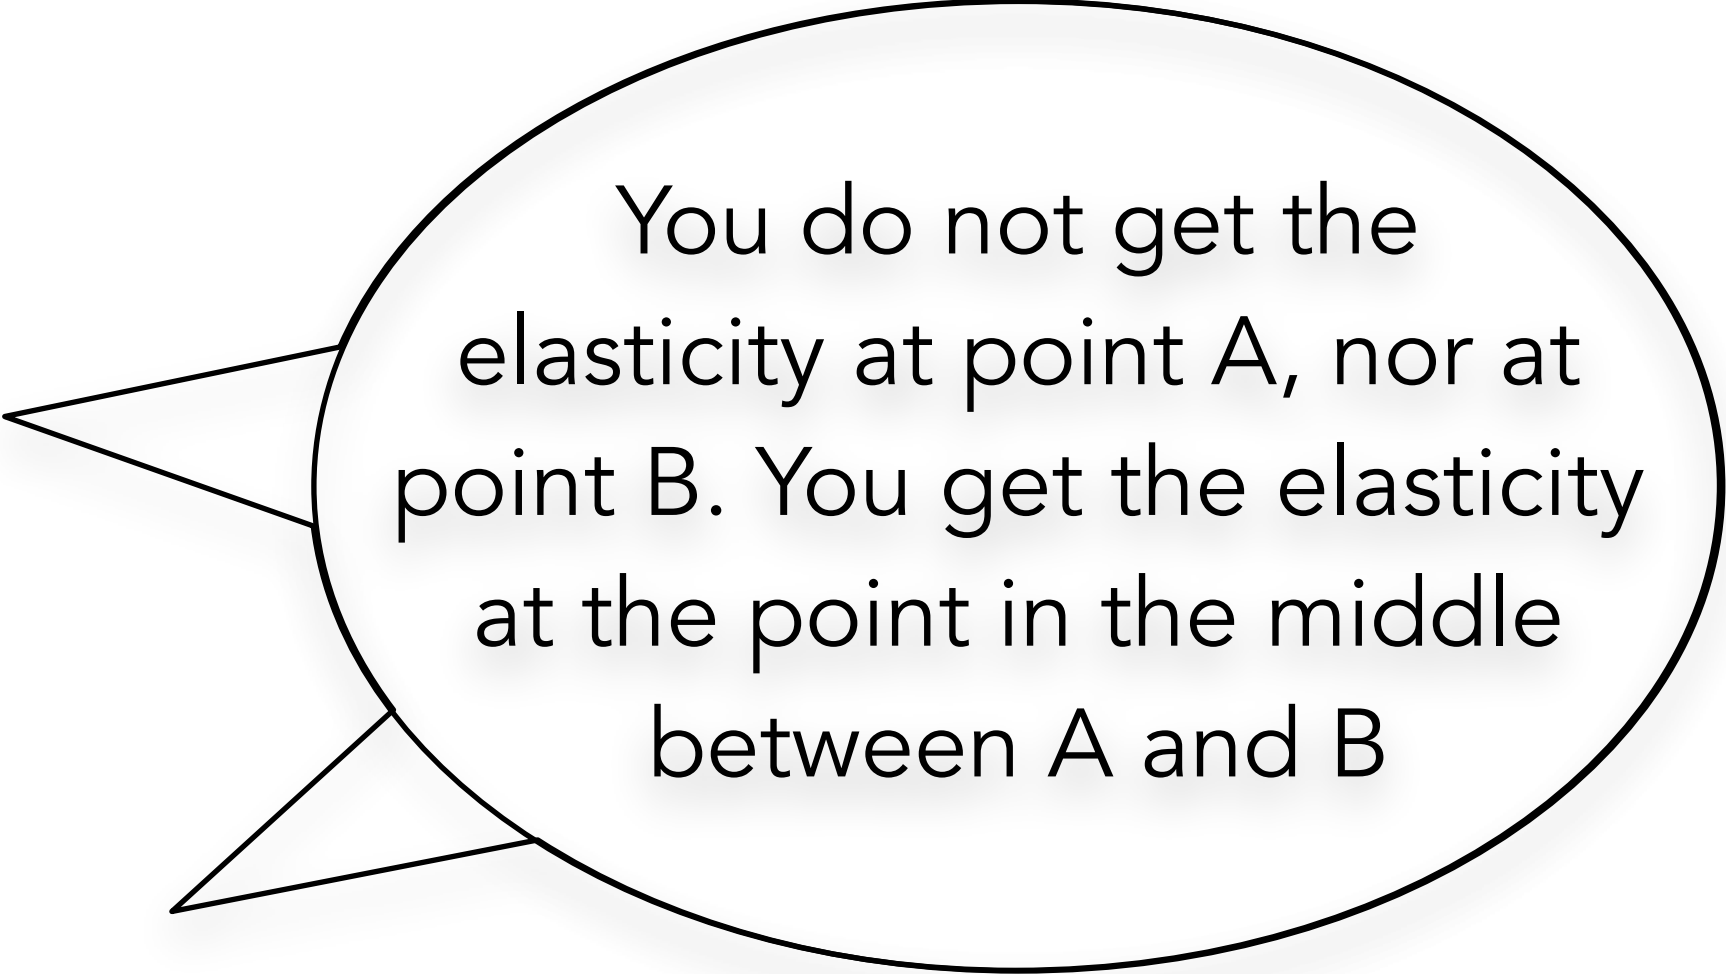

Gives the elasticity at the

Midpoint

A thick red curved arrow that starts from the right side of the word 'Midpoint' and points left towards the red circle bullet point.

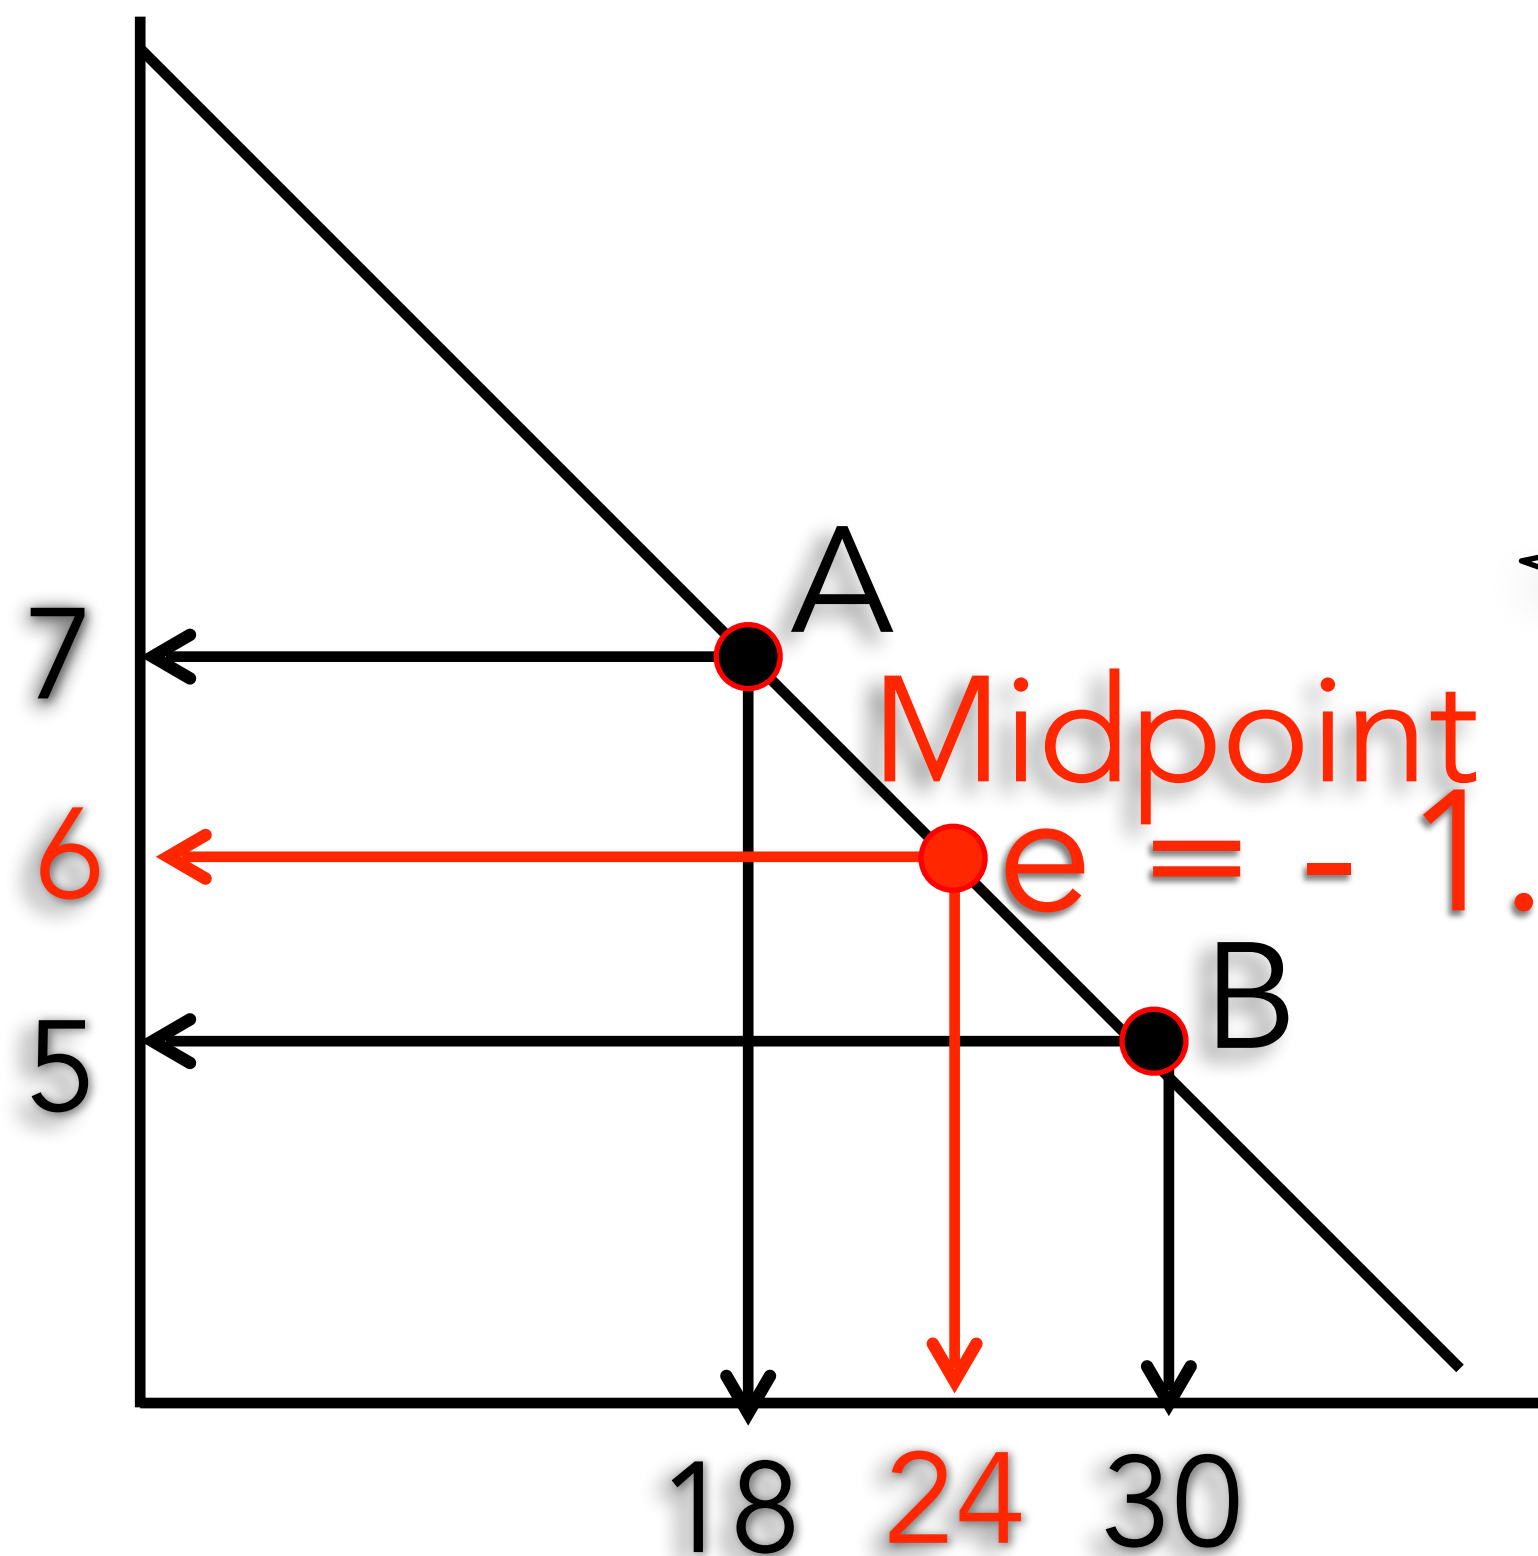

You do not get the
elasticity at point A, nor at
point B. You get the elasticity
at the point in the middle
between A and B

Midpoint

$e = -1.51$

Average price
 $(7+5)/2 = 6$

Average quantity:
 $(30+18)/2 = 24$

Midpoint
 $e = -1.51$

You do not get the elasticity at point A, nor at point B. You get the elasticity at the point in the middle between A and B

To calculate the elasticity at one point:
