

A

E

A

E

Total
Production

AE

=

Y*

No change in
inventories

Where the two lines cross:

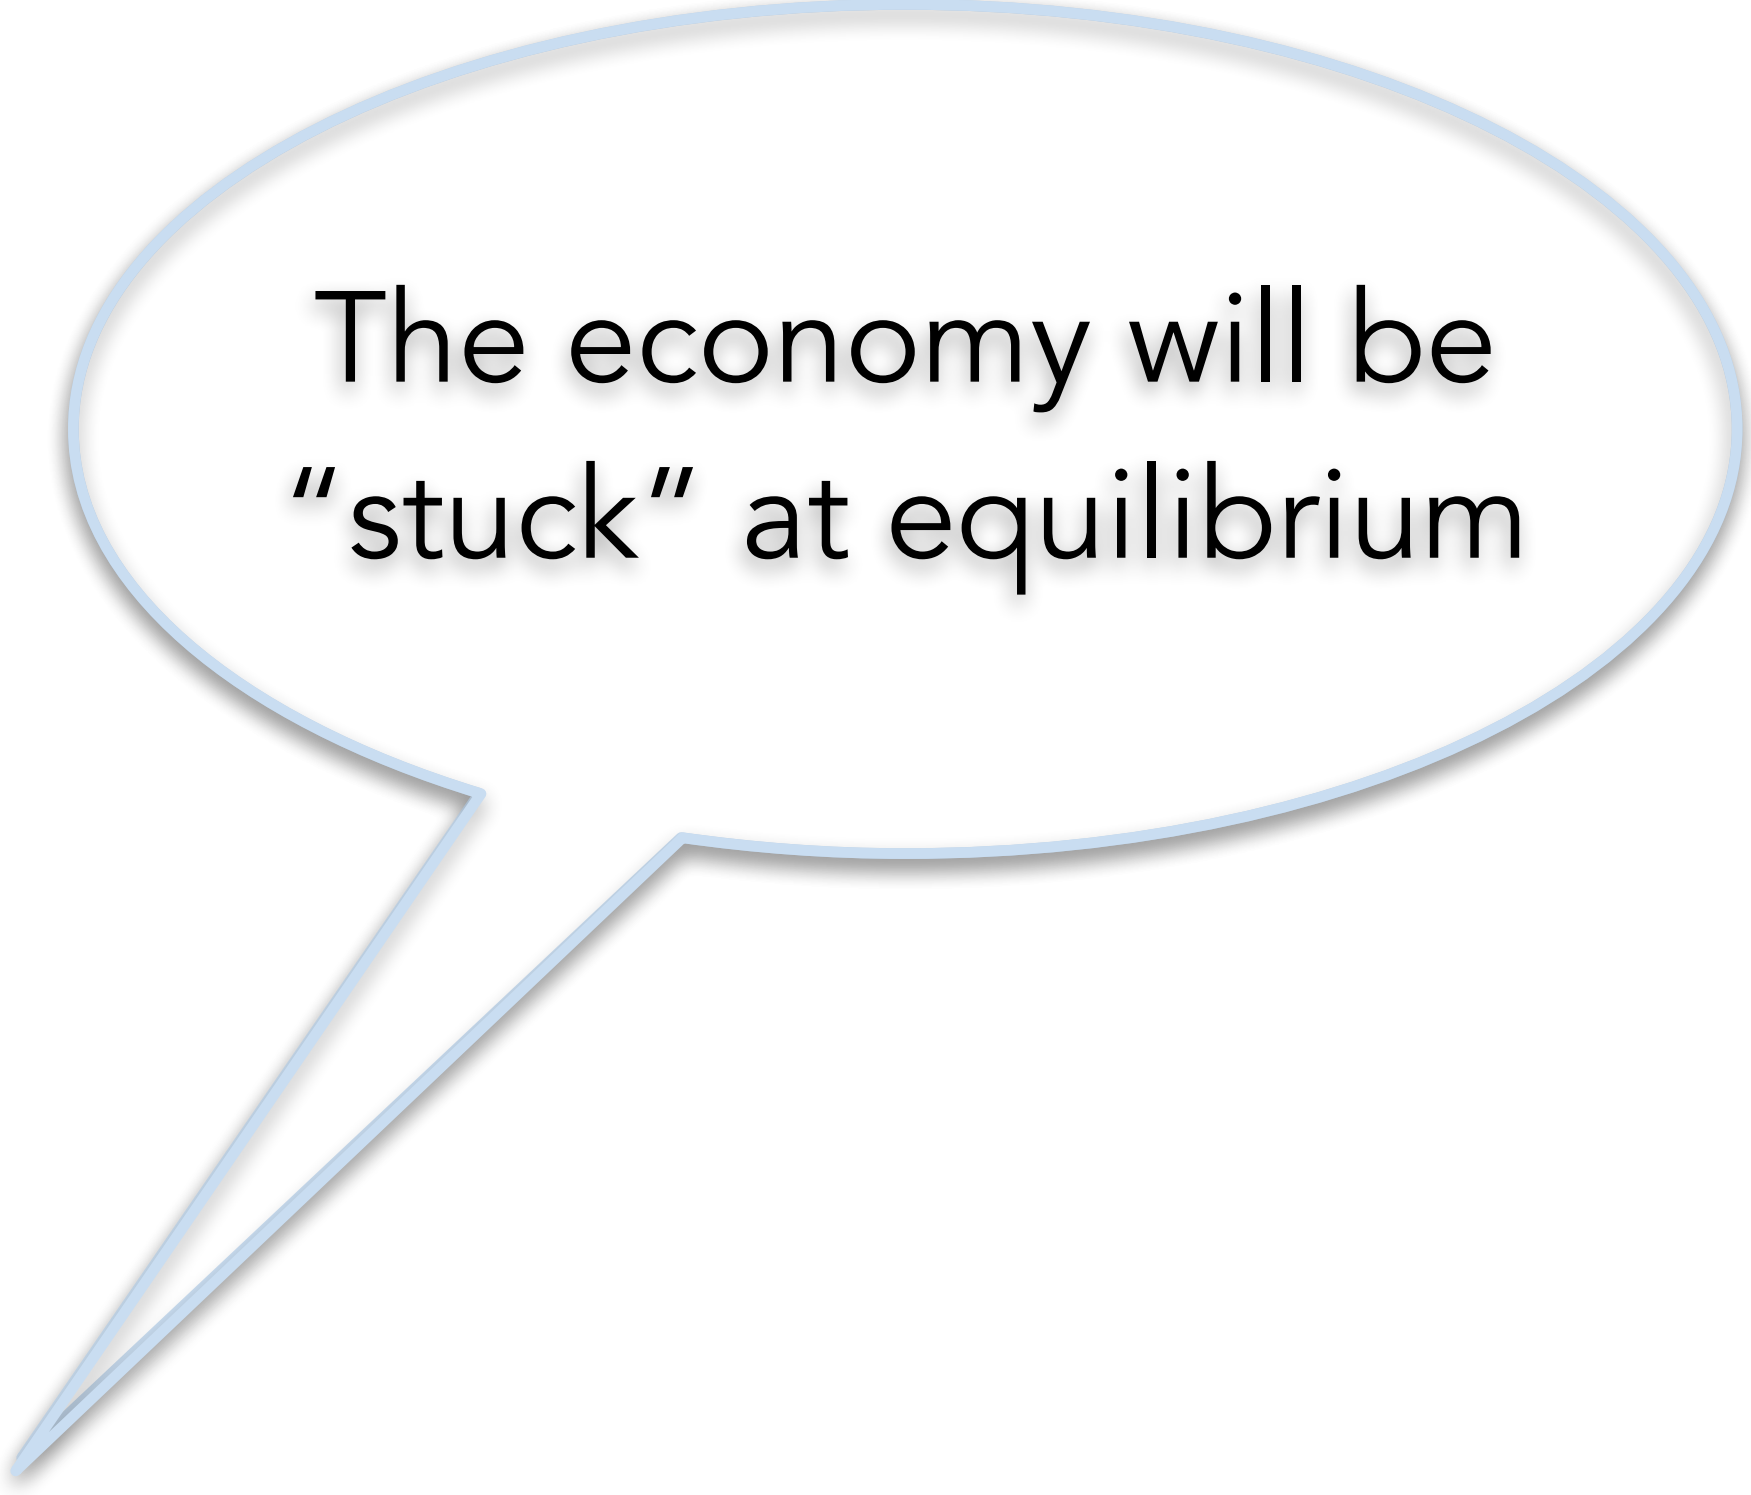

Total Production is the

same as the AE

When firms produce
 Y^* the economy is at
equilibrium

Firms will continue to produce Y^* quarter after quarter...

The economy will be
"stuck" at equilibrium

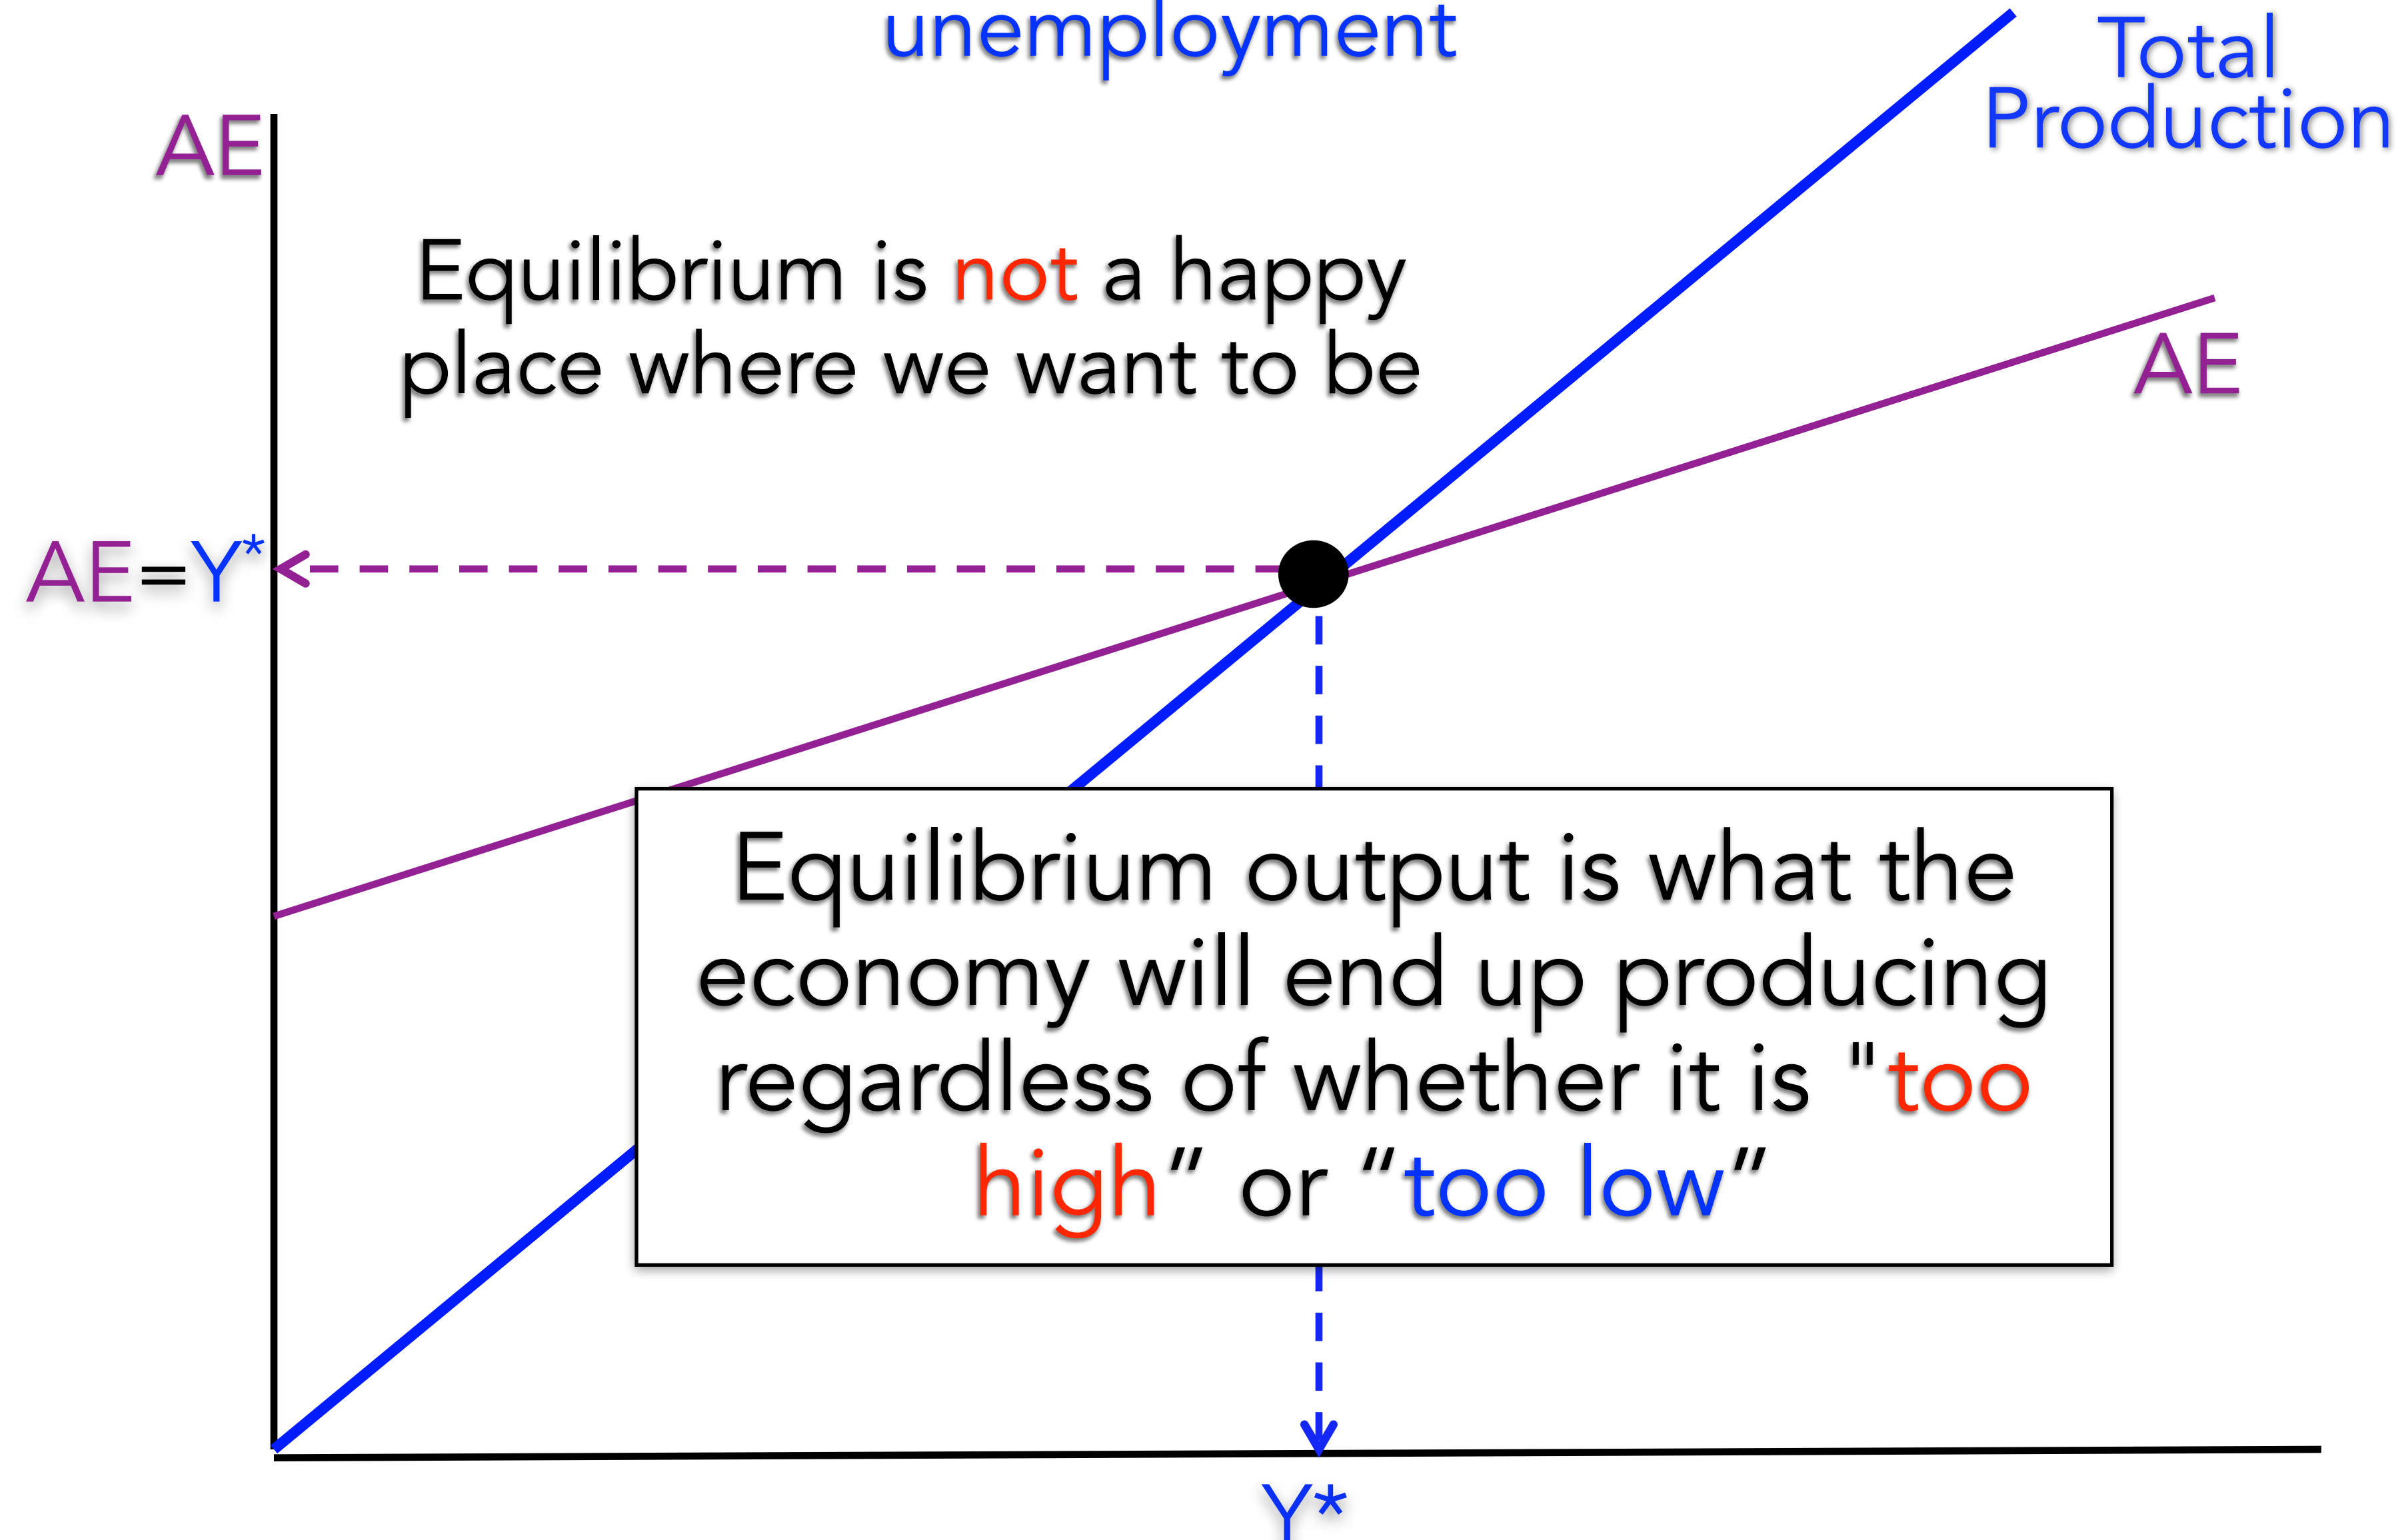

Equilibrium output may be “too low” with massive
unemployment

Equilibrium output may be "too high" with rampant
inflation

Equilibrium is **not** a happy
place where we want to be

Equilibrium output is what the economy will end up producing regardless of whether it is "too high" or "too low"

Equilibrium output may be "too low" with massive unemployment

Equilibrium output may be "too high" with rampant inflation
