$TP_{L=4} =$

$$+ + + = 240$$

$$AP_{L=4} = \frac{\quad}{4} = 60$$

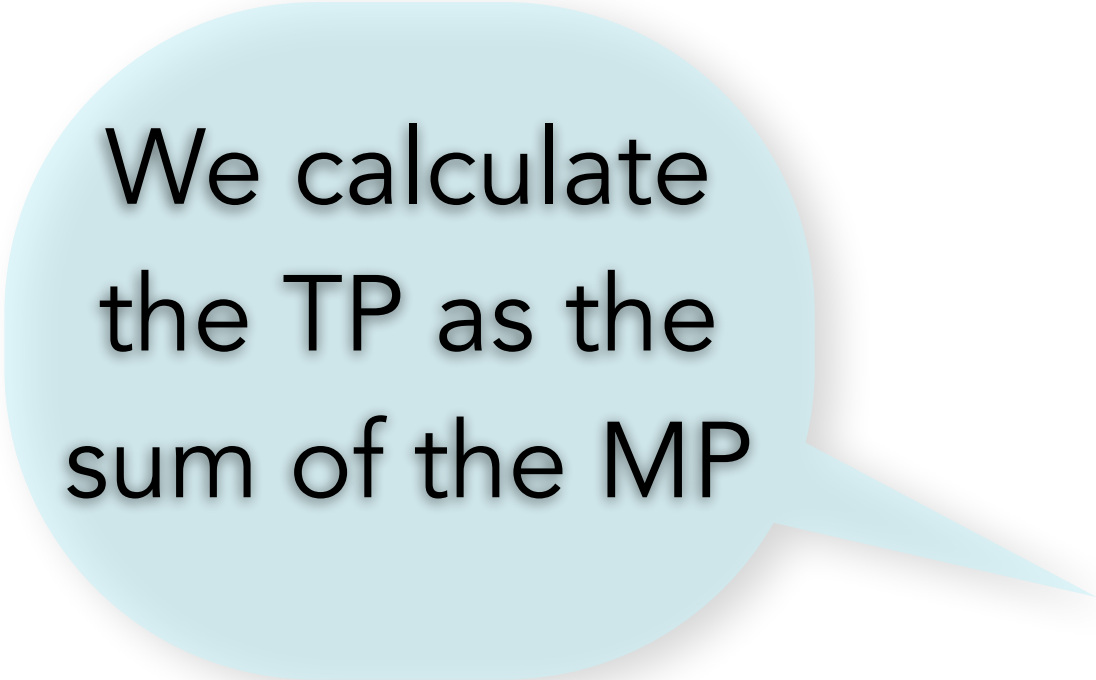

MP<sub>4</sub>

30

Suppose we have the **MIP** for three workers:

If the next worker's MP is lower than that average (70)

Average fall

We calculate  
the TP as the  
sum of the MP

We calculate

$$AP = TP/L$$

$TP_{L=3} =$

$$+ + = 210$$

$$AP_{L=3} = \frac{\quad}{3} = 70$$

Suppose we have the **MP** for three workers:

We calculate  
the TP as the  
sum of the MP

$$AP_{L=3} = \frac{TP_{L=3} = 50 + 70 + 90 = 210}{3} = 70$$

We calculate  
 $AP = TP/L$

If the next worker's **MP** is **lower** than that average (70)

$$AP_{L=4} = \frac{TP_{L=4} = 50 + 70 + 90 + 30 = 240}{4} = 60$$

Average fall

Suppose we have the **MP** for three workers:
