

$$\text{Disposable Income}(Y^d) = \text{Income}(Y) - \text{Taxes}(Tx) + \text{Transfers}(Tr)$$

Disposable Income: Income left for consumption and saving after paying **Taxes** and receiving **Transfers**

Without Government: $C = a + MPC(Y)$

We need to change the consumption
function to reflect this change:

With Government: $C = a + MPC(Y - Tx + Tr)$

Yd

$=$

Y

$-$

T

X

$+$

Tr

Disposable Income(Y^d) = Income (Y) - Taxes(T_x) + Transfers(Tr)

$$Y^d = Y - T_x + Tr$$

Disposable Income: Income left for consumption and saving after paying **Taxes** and receiving **Transfers**

We need to change the consumption function to reflect this change:

Without Government: $C = a + MPC(Y)$

With Government: $C = a + MPC(Y - T_x + Tr)$
